## |-  Missing               |                4                |
```

As a note, I didn't include the "states" variable as the output was huge and not that helpful. Suggest we include a note somewhere that data from 50 states + Washington, DC.

Distribution of Outcome Data

Histogram of raw outcome data (hate crimes per 100k).

```r
hate_df %>%
  ggplot(aes(x = hate_crimes_per_100k_splc, y = ..density..)) +
  geom_histogram(bins = 11) +
  geom_density(alpha = 0.2, color = "blue") +
  labs(
    x = "Hate Crimes per 100k",
    y = "Density"
  )
```
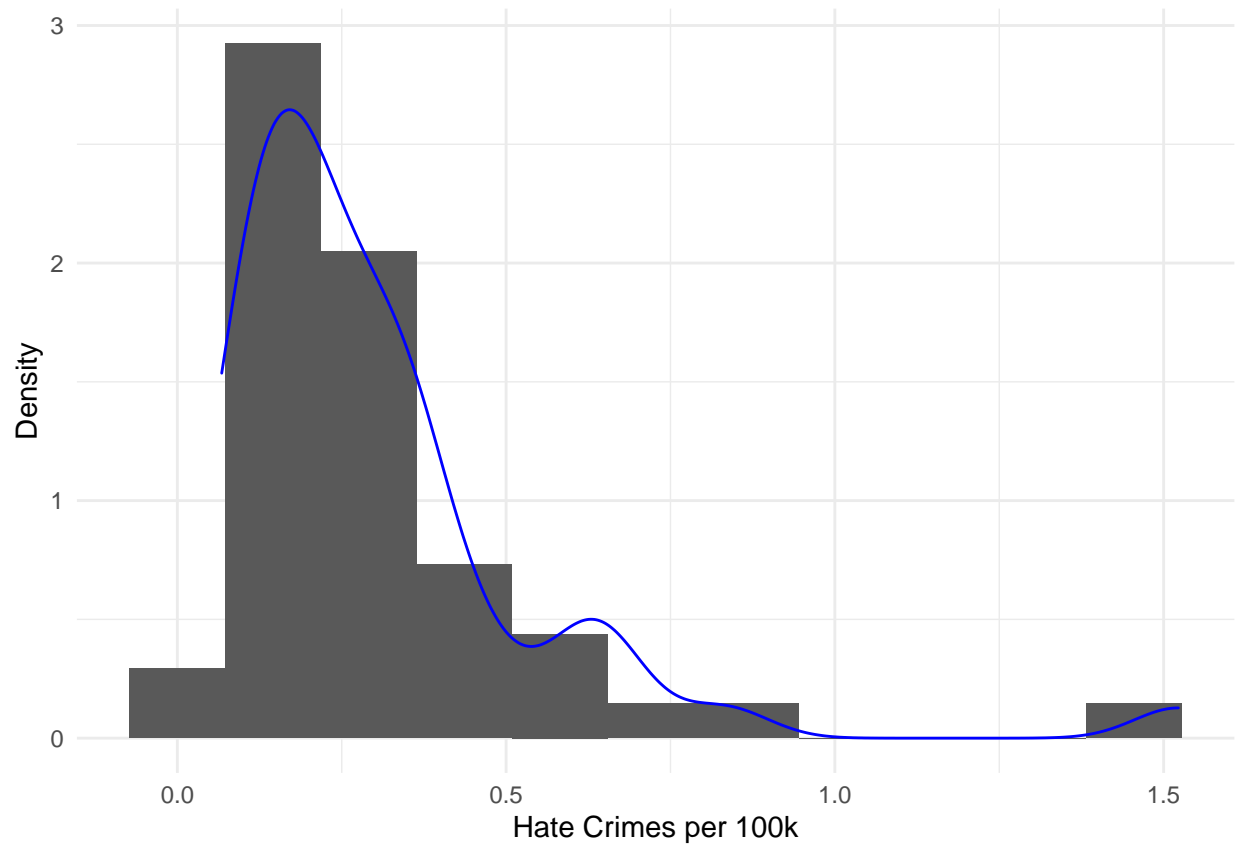

These data look skewed :(

Histogram of log-transformed outcome data (hate crimes per 100k).

```
hate_df %>%
  ggplot(aes(x = log(hate_crimes_per_100k_splc), y = ..density..)) +
  geom_histogram(bins = 11) +
  geom_density(alpha = 0.2, color = "blue") +
  labs(
    x = "Hate Crimes per 100k (Log Scale)",
    y = "Density"
  )
```

Looks better!

Box plot of the (raw) outcome data.

```r
hate_df %>%
  ggplot(aes(y = hate_crimes_per_100k_splc)) +
  geom_boxplot() +
  labs(
    y = "Hate Crimes per 100k"
  ) +
  theme(
    axis.text.x = element_blank(),
    axis.ticks.x = element_blank()
    )
```
Just based on the box plot, it looks like there are two states with potential usually high rates (Washington, DC and Oregon).

Examining Potential Multicollinearity

```
hate_df %>%
  select(
    hate_crimes_per_100k_splc,
    median_household_income,
    perc_population_with_high_school_degree,
    perc_non_citizen,
    gini_index,
    perc_non_white
    ) %>%
  cor(use = "complete.obs") %>% # Ignoring NA values
  round(., 2)
```

```
##                                         hate_crimes_per_100k_splc

## perc_non_white                                 1.00
```

Based on this output, the following pairs of variables have a correlation of 60% or higher:

- Percentage non-citizens & percentage non-white (0.75)

- Median household income & percentage of population with a high school degree (0.65)

```
hate_df %>%
  select(
    hate_crimes_per_100k_splc,
    median_household_income,
    perc_population_with_high_school_degree,
    perc_non_citizen,
    gini_index,
    perc_non_white
    ) %>%
  pairs()
```
Simple Linear Regression Using Income Inequality (Per FiveThirtyEight)

Fitting SLR using income inequality (measured by Gini index) per FiveThirtyEight findings.

```
slr_gini_lm = lm(hate_crimes_per_100k_splc ~ gini_index, data = hate_df)

```

Gini index appears to be a significant predictor only when using the raw outcome data (not the log-transformed outcome data).

Scatter plots associated with these simple linear regression models.

```r
hate_df %>%
  ggplot(aes(x = gini_index, y = hate_crimes_per_100k_splc)) +
  geom_point(color = "blue", alpha = 0.6) +
  labs(
    x = "Gini Index",
    y = "Hate Crimes per 100k"
    ) +
  geom_abline(intercept = -1.5275, slope = 4.0205)
```
```
hate_df %>%
  ggplot(aes(x = gini_index, y = log(hate_crimes_per_100k_splc))) +
  geom_point(color = "blue", alpha = 0.6) +
  labs(
    x = "Gini Index",
    y = "Hate Crimes per 100k (Log Scale)"
    ) +
  geom_abline(intercept = -3.676, slope = 4.932)
```
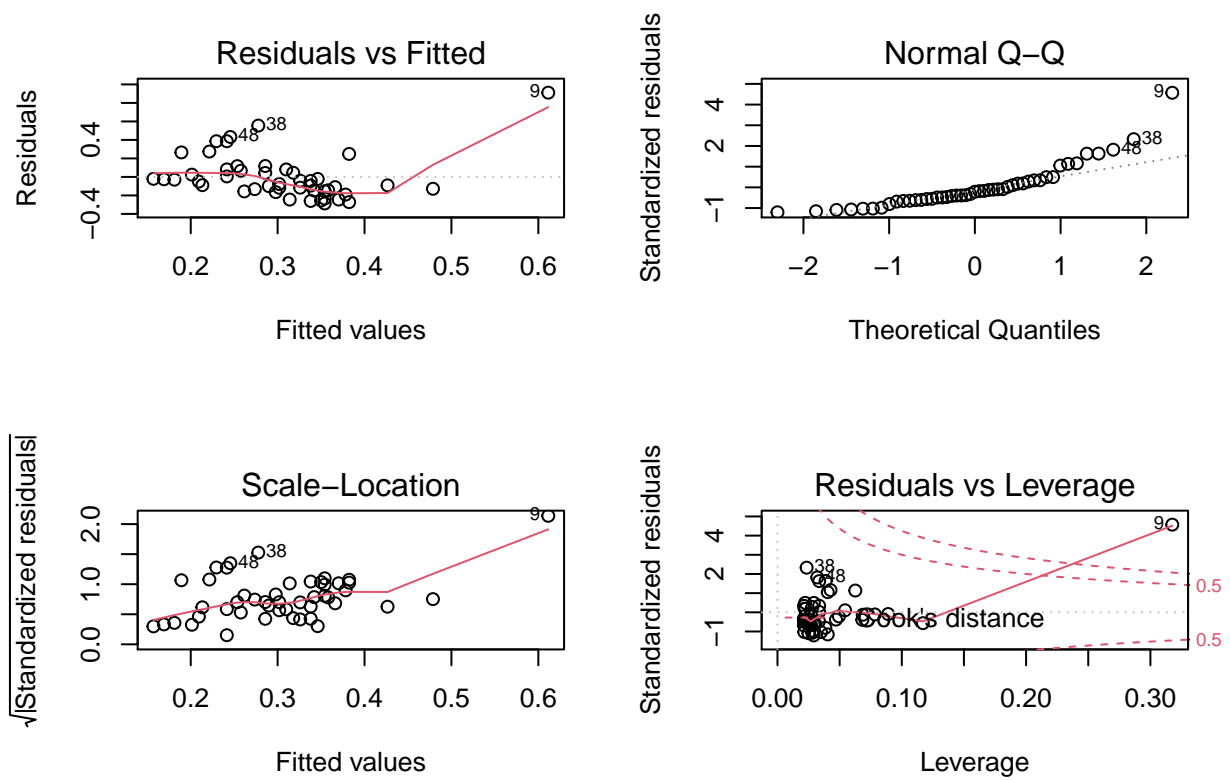

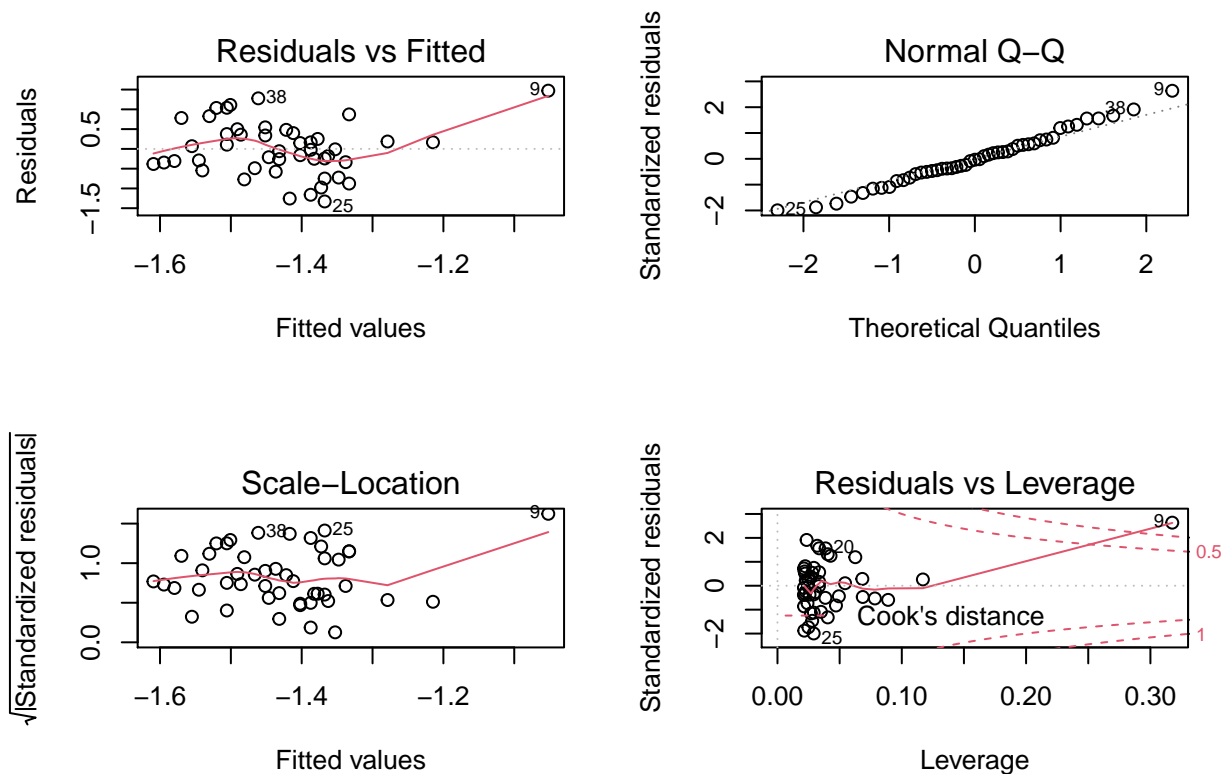

Diagnostic plots of these two simple linear regression models.

```
par(mfrow = c(2, 2))
plot(slr_gini_lm)
```

```
plot(slr_gini_log_lm)
```

Normality looks better when we perform the log transformation on the outcome data. However, for both versions of this model, we can see an outlying value in the upper right corner (this corresponds to Washington, DC).

Trying Stepwise Approach

As a first step, trying stepwise approach.

```
hate_nona_df = # Removing rows with missing values from the dataset
  hate_df %>%
  drop_na()

full_lm = lm(
  hate_crimes_per_100k_splc
  ~ unemployment +
    urbanization +
    median_household_income +
    perc_population_with_high_school_degree +
    perc_non_citizen +
    gini_index +
    perc_non_white,
  data = hate_nona_df
)

full_log_lm = lm(
```

```
  log(hate_crimes_per_100k_splc)
  ~ unemployment +
    urbanization +
    median_household_income +
    perc_population_with_high_school_degree +
    perc_non_citizen +
    gini_index +
    perc_non_white,
  data = hate_nona_df
)

step(full_lm, direction = "both") # Trying "both" directions
```

```
